Water Cannons

Defender Fire and Safety Inc. is proud to introduce our version of a high volume water cannon. Capable of creating a maximum 100' radius wet line at optimal pressure and flow with a directional impact sprinkler head with a 3/8" nozzle flowing 45 GPM at 100 PSI. With a vertical ballast that keeps the centre of gravity low to the ground and provides approximately 34 pounds of counter weight keeping these sprinklers firmly in place during operation.

These sprinkler cannons are ideal for covering a large area quickly and effectively where water supply is not an issue and water pressure can be maintained. They have been used to protect large structures such as schools, barns, and mills as well as used during mop up operations to remove people from potentially dangerous areas or simply free up personnel while they soak down a large area of fuels that are still hot, unburnt, or have the potential to flare up given the right conditions.
